Mastère Spécialisé Big Data**

Télécom ParisTech

Contribution au développement d'outils
d'apprentissage automatique et d'aide à la décision
dans le processus de gestion et d'optimisation
des levées de capitaux à destination des sociétés privées

Kaëlig CASTOR

27 Septembre 2021

Plan de l'exposé

1. Introduction

- a. Présentation de la fintech Praexo
- b. Contexte des projets

2. Système de recommandation d'investisseurs

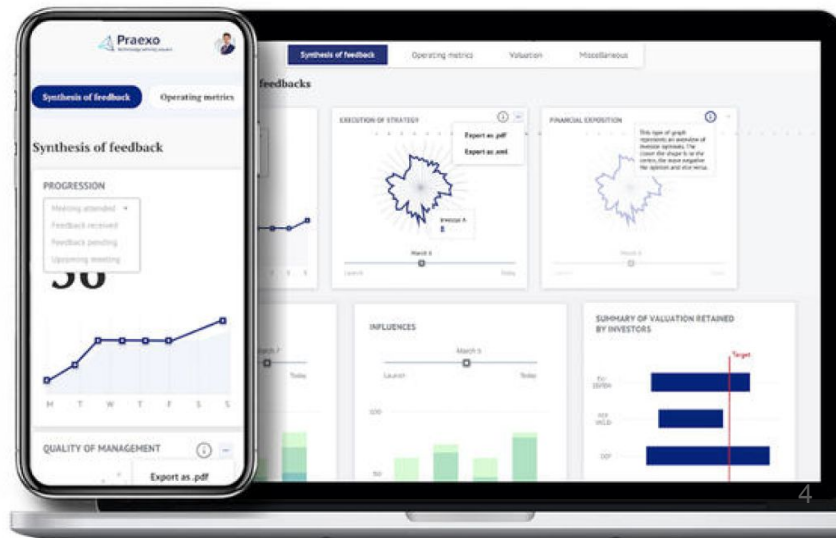

- a. Création de la base de données
- b. Modèles développés
 - Auto-encodeur
 - PCA
 - **Régression d'arbre de décision à gradient boosté**
- c. Analyse et conclusion

3. Classification de commentaires d'investisseurs

1. Introduction

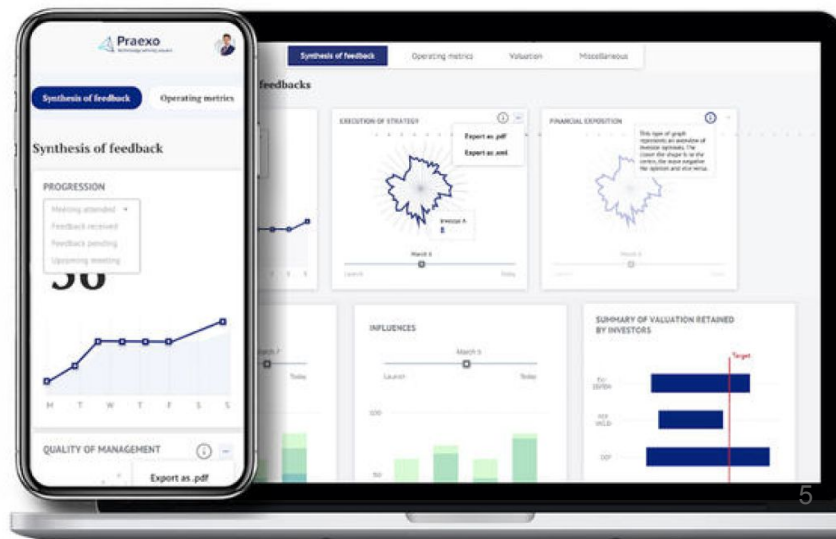

La société Praexo : digitalisation de la levée de capitaux

1. **Création en 2019** par Guillaume Moinet, banquier d'affaires chez Rothschild & Co
2. 1^{ère} levée de 1.6M€ en mai 2020
3. Exploiter et analyser les données pour optimiser la relation entreprise-investisseur
 - Accompagner les sociétés en préparant et améliorant l'exécution de leurs levées de capitaux (3 ou 4 ans avant leur possible IPO)
 - **Mieux cibler les bons investisseurs, anticiper et comprendre leurs attentes** (*equity story*)
 - Dynamiser l'intérêt de l'investisseur - aide à la décision
4. **~10 personnes** :
 - Business Team
(3 banquiers senior + 2 stagiaires)
 - Data Science Team (1 + 2 stagiaires) :
data lake, ML
 - Tech Team
(1 CTO + 2 front-end developers) :
data viz, back-end, infra

La plateforme Praexo : une communication directe

1. Tableau de bord (web + app) - état d'avancement de la transaction
 - Liste investisseurs impliqués + retours investisseurs synthétisés
 - Suivi en temps réel des métriques de valorisation et des KPI
2. Module d'interface
 - Système de dialogue / commentaires - questions/réponses entre entreprise et investisseurs
 - Système de réservation de commandes
3. Modèle d'analyse financière
 - Outils d'estimations - comparaison d'hypothèses
 - Mesures d'impact sur les notations
4. Accompagnement des clients avec l'expertise métier des banquiers d'affaires

Contexte des Projets

1. Système de recommandation d'investisseurs

- User (transaction) - Item (investisseur)
- Caractéristiques des investisseurs et des investissements passés (critères géographiques, secteurs d'activité, style d'investissement, montant des transactions, du ticket moyen des investisseurs, etc)

2. Classification de commentaires d'investisseurs

- Synthèse et catégorisation automatique des retours des analystes
- Forces, faiblesses, et perception générale de la compagnie

2. Système de recommandation d'investisseurs

```

Prétraitement des données

1. Extraction et nettoyage des données

- Transactions de moins de 2 investisseurs
- Transactions antérieures à 2018
- Transactions de certains types : PIPE, Secondary Transaction_ Private, Seed Round, Grant and Equity for Service

2. Création de nouvelles features

- Standardisation des données géographiques en une seule variable : `Hq_Country_Code`
- Fusion de deux features en élargissant la tolérance suivant une nomenclature
(`deal_Type`, `deal_Serie`) => `deal_Emission`
- Génération de l'historique de certaines features
(taille de deals, géographie et secteur des investissements, etc)
- Comptage d'occurrence de certaines features

3. Encodage des variables catégorielles

4. Vectorisation des données (Embedding)

Premier Modèle : Auto-Encodeur

- ❖ Réseau de neurones avec TensorFlow et Keras
- ❖ Label Encoding pour features catégorielles puis MinMaxScaler pour normaliser les données
- ❖ Split des données : 80% entraînement, 20% validation
- ❖ 8 couches cachées
- ❖ Modèle compilé avec l'optimisation ADAM, la fonction de coût MSE, et la métrique MAE

→ En sortie de prédiction du modèle, les sorties ne sont pas une liste d'investisseurs mais des poids de **caractéristiques estimées**. Une mesure de distance détermine la similarité pour sortir une liste 100 meilleurs investisseurs suggérés. On calcule la précision du modèle en comparant ces investisseurs avec les investisseurs réels qui ont investi dans la transaction.

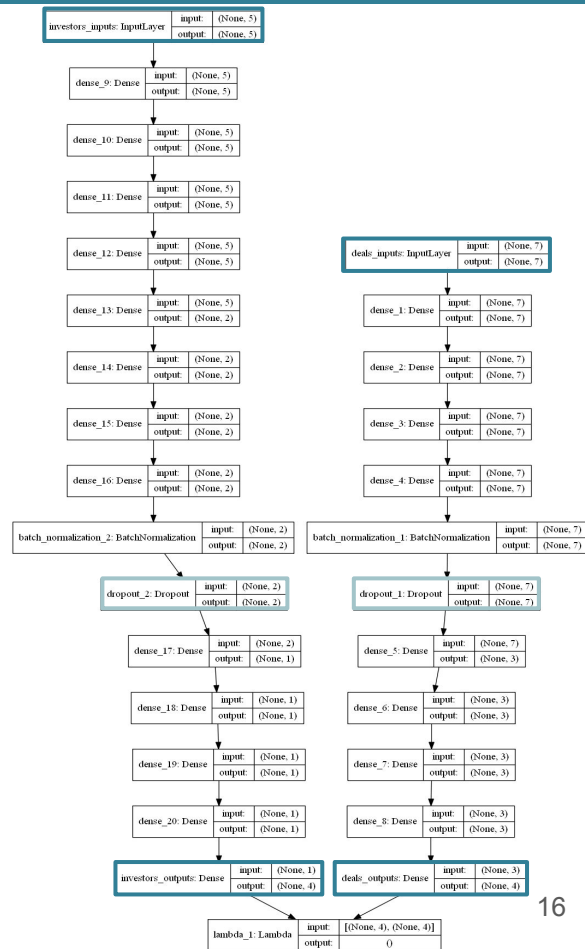

7 caractéristiques d'entrée pour les transactions :

- deals_primaryIndustryGroup,
- deals_primaryIndustrySector,
- deals_primaryIndustryCode,
- deals_emission,
- deals_dealSize,
- deals_hqCountryCode,
- deals_FollowOnInvestors,

et 5 caractéristiques d'entrée pour les investisseurs :

- investors_primaryInvestorType,
- investors_histIndustryGroup,
- investors_histHqCountryCode,
- investors_histPrimaryIndustryCode,
- investors_hqCountryCode.

Deuxième Modèle : PCA

- Seules les données des transactions sont utilisées
- 6 Inputs : 5 caractéristiques catégorielles ('deals_primaryIndustryGroup', 'deals_primaryIndustrySector', 'deals_primaryIndustryCode', 'deals_emission', 'deals_hqCountryCode') + 1 caractéristique numérique ('deals_dealSize')
1 Output : 'deals_investors'
- Prétraitement : Duplication des lignes de variables catégorielles à champs multiples de one-to-many à one-to-one, Dropna (35619 -> 17855 lignes),
Label Encodage des variables catégorielles => **X[17855, 6] user matrix**
- Construction de la matrice de correspondance **OneHot = [17855, 13842]** (=len(deals_investors), len(index_to_investor))
- Factorisation et compression - Embedding avec SVD/PCA : **OneHot ~ Y[17855, 200]** x S x E[200, 13842]
- Reconstruction de chaque ligne (transaction) => 100 coefficients les plus élevés = liste de prédiction

```
Total recall: 71.4 %  
Total accuracy: 4.5 %  
Nb of non-null predictions: 13219 over 17855 (74.0%)
```

- On ne garde que les deals dont la prédiction est non-nulle lors la reconstruction (X -> X_sliced, Y -> Ysliced)
- Train-test split (80-20) :
X_sliced[13219, 6] -> **X_train[10575, 6]** **X_test[2644, 6]**
Y_sliced[13219, 200] -> **Y_train[10575, 200]** **Y_test[2644, 200]**
- **Y_prediction = Regression_Model(X, Y)** => reconstruction **OneHot_prediction** => 100 coefficients les plus élevés = liste de prédiction

Deuxième Modèle : PCA

- 2 différents modèles :
 - Arbre de régression à gradient boosté (XGBoost)
 - Réseau de neurones à propagation avant (FFNN)

- 4 tests différents :

Résultats

- FFNN (sortie : liste de 100 prédictions) 4525 intersections non-nulles sur 10575 (42.8%)
=> 25.8 % rappel total
- FFNN (sortie : liste de 1000 prédictions) 8173 intersections non-nulles sur 10575 (77.3%)
=> 44.7 % rappel total
- XGBoost (sortie : liste de 100 prédictions) 4585 intersections non-nulles sur 10575 (43.4%)
=> 25.8 % rappel total
- XGBoost (sortie : liste de 1000 prédictions) 8265 intersections non-nulles sur 10575 (78.2%)
=> 45.2 % rappel total

Troisième Modèle : LGBM

- ❖ Méthode d'ensemble de type régression d'arbre de décision optimisé (Implémentation LightGBM du gradient boosting)
- ❖ Création de **nouvelles features** (`Featurer`):
 - **Temporalité** : comptage - des occurrences de différentes features sur la dernière année (`DealCounter`)
 - du nombre de jours depuis la dernière transaction pour des features spécifiques (`DaysSinceLastDealCounter`)
- ❖ `aikit NumericalEncoder` pour features catégorielles puis `MinMaxScaler` pour normaliser les données
- ❖ Training :
 - **L'ensemble des investisseurs est labellisé, suivant deux classes, ayant investi ou non**
 - **On sélectionne aléatoirement 2% des données pour l'entraînement du modèle (limite les ressources temps de calcul, rééquilibre la classe minoritaire)**

→ AUC	: 90.9%
Average Precision	: 3.8%
Mean AUC	: 89.7%
Mean Average Precision	: 8.7%
Mean Recall	: 35.9%

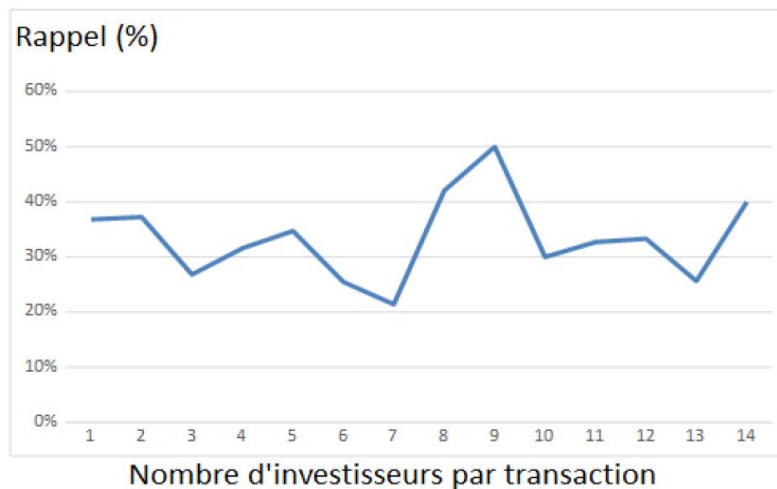

Comparaison des trois approches

lgbm est favorite (création de nouvelles features)

	Précision Moyenne (%)	Rappel Moyen (%)
Méthode 1 (Auto-Encodeur)	10	17
Méthode 2 (SVD)	2	28
Méthode 3 (Lgbm)	10	38

Troisième Modèle : Variations du Rappel

Case 1	Case 2	Case 3	Case 4
Original Database + drop incomplete deals	Enlarged Database (including small deals) + drop incomplete deals	Enlarged Database (including small deals)	Enlarged Database (including small deals) + historical new features
Keeping 10487/18828 deals	Keeping 23048/61919 deals	Keeping 53412/61919 deals	Keeping 53412/61919 deals
25.5% mean Recall	27.8% mean Recall	33% mean recall	37.5% mean recall

Troisième Modèle : Explicabilité

- Comprendre le modèle : pourquoi une recommandation a été faite et l'importance des différents facteurs contribuant à ce choix
- Librairie **SHAP** d'explication des **caractéristiques** (*i.e. SHAP, SHapley Additive exPlanations*) quantifie la contribution que chaque feature apporte à la prédiction effectuée par le modèle.
- Exemple : entreprise Linkcy pour laquelle on a vérifié un problème de **surreprésentation d'investisseurs locaux** dans les recommandations
- Trouver ajustement de l'importance des features dans les prédictions en accord avec nos besoins business

FEATURE	OCCURRENCE
Investor located in company state	96
Number of deals last year	90
Company state	76
Investor located in company region	58
Number of deals on country last year	34
Number of deals of deal type last year	28
Days since last deal on industry sector last year	24
Days since last deal on deal type last year	23
Days since last deal on region last year	21
Investor located in company city	19
Days since last deal last year	14
Investor AUM	6
Number of deals on verticals last year	6
Number of deals on region last year	2
Deal size (m\$)	1
Investor age (in years)	1
Number of deals on industry sector last year	1

Troisième Modèle : Analyse des prédictions nulles

Analyse séries

	recall = 0	recall = 0 (%)	Total	Total (%)	recall = 0/Total
Series A	63	52 %	123	42 %	51 %
Series B	33	27 %	78	27 %	42 %
Series C	15	12 %	56	19 %	27 %
Series D	5	4 %	21	7 %	24 %
Series E	5	4 %	13	4 %	38 %
Series F	0	0 %	2	1 %	0 %
Series H	0	0 %	1	0 %	0 %
	121		294		

Le nombre de prédictions nulles (prédictions ne contenant aucun bon investisseur) décroît au fur et à mesure du nombre de tours de financement (de la série A à H).

On peut donc comprendre que les caractéristiques intégrant l'historique des transactions pour une même société joue un rôle important dans la qualité des prédictions des investisseurs.

Troisième Modèle : Cas d'usage - entreprise Mirakl

Site Paris, France

Business Status Generating Revenue

Deal Synopsis

The company raised \$300 million of Series D venture funding in a deal led by Permira on September 22, 2020, putting the company's pre-money valuation at \$1.2 billion. Elaia Partners, 83North, Felix Capital, and Bain Capital Ventures also participated in the round. The funds will be used to reinforce clear leadership, significantly invest in technology and partner ecosystem, and growing the team to meet the rapid adoption of the marketplace model.

Deal #7 Later Stage VC (Serie D) \$300M completed on the 22nd of Sept. 2020

† Not necessarily a summation of individual debt figures.

** Does not include grant funding

Parmi les 30 listes de 100 investisseurs, on a **190 investisseurs uniques suggérés** et triés par probabilité. **2 investisseurs** (Elaia Partners and Permira) **sont trouvés parmi les 5 investisseurs réels** (comme attendu, le score de prédiction est rappel=40%).

Systeme de recommandation d'investisseurs :

Conclusions et perspectives

Système de Recommandation : Conclusion et Perspectives

Conclusion

- Scraping des données Pitchbook de transactions pour le financement des entreprises à l'échelle globale
- 3 approches RecSys totalement différentes ont été développées, elles sont basées sur :
 - o un auto-encodeur
 - o une PCA
 - o **Régression d'arbre de décision à gradient boosté**
- Importance de la **création de nouvelles features** avec statistiques (rapport de features, comptages, temporalité)
- Présence de nombreuses sorties non-pertinentes. Minimiser l'occurrence de faux-positifs dans les résultats
- Améliorer le modèle d'extraction : Filtrage des investisseurs non pertinents pour la transaction afin d'optimiser ensuite l'étape de ré-équilibre des classes.
- Cas d'usage -> bon accueil par une communauté de professionnels tels que BNP Paribas (*early adopter*)

Perspectives

- Automatisation et actualisation fréquente de la base de données afin de ré-entraîner régulièrement les modèles
- Revue régulière de la littérature concernant les méthodes (Embedding / Categorical Encoding Methods)
Modèles de Word Embedding (Word2Vec, glove). Bonne représentation vectorielle des mots du champs lexical spécifique
- L'influence contextuelle relative aux critères géographiques doit être mieux maîtrisée. On doit pouvoir demander au système une flexibilité dans le paramétrage afin d'obtenir des recommandations plus ou moins localisées dans certaines régions, en fonction du choix de l'utilisateur.
- Considérations business pour augmenter les performances de la solution actuelle

3. Classification de commentaires d'investisseurs

Classification de commentaires d'investisseurs : roadmap

- **Création d'un corpus de texte non-labellisé :**
 - Extraction et prétraitement du texte RAW à partir de fichiers .pdf (`tika parser`)
 - Extraction des phrases à partir du texte (`nltk tokenizer`)
 - Nettoyage final du corpus (lowercase, borner le nombre de mots par phrase, etc)
- Utiliser **des catégories déterminées** par l'équipe business (50 classes qualitatives)
- **Classification Zero-Shot** de BERT (*Bidirectional Encoder Representations from Transformers*)
(`transformers "zero-shot-classification" pipeline`)
 - L'apprentissage Zero-Shot : On force le réseau de neurones à effectuer la classification dans des classes pour lesquelles il n'a jamais été entraîné.
Modèle pré-entraîné sur un corpus de texte de taille massif (*i.e.* `BartModel`, `BertForClassification`).
 - Possibilité immédiate de faire de la classification Force / Faiblesse
(`transformers "sentiment-analysis" Text Classification pipeline`)

Classification de commentaires d'investisseurs : cas d'usage

- Une analyse de perception permet d'extraire un corpus de 3802 phrases
- Le pipeline suppose par défaut qu'une seule des étiquettes candidates est vraie, renvoyant une liste de scores pour chaque étiquette qui totalisent 1 (multi_class=False). On utilise l'option Multi-classe (multi_class=True) pour laquelle les scores sont indépendants, mais chacun est compris entre 0 et 1.

best_class	sentence	max_score
Cash-flow	these type of things, we can see it, but our first focus is in terms of cash flow .	84.0
Cost inflation	then there is the cost inflation so they have to deal with some market topic.	84.0
resiliency	the second thing is probably the resilience , except probably the hospitality part of the business.	82.3
Governance	we rank governance quite high at 7.5, so 7 or 8 is fine for me.	81.0
Social	i am talking about the social background , which will impact the economy.	78.8
Leverage	leverage is one of these things where people think you should have more and more leverage and then they suddenly decide you should not have leverage and those two things can be a week apart.	78.0
Shareholders	in this area, we are shareholders as you may know.	75.7
Capital intensity	i suppose a weakness you could point to on the strategy is that it is capital-intensive although that is a barrier, so it can have a reasonable level of debt.	75.0
Financial Position	perception study - january 2019 financial position (cont.)	70.9
Revenues growth	not so good at organic revenue growth - dk partners i like them very much.	67.8
Commodity prices	the last negative is just in terms of raw materials ; it does impact them, any movement in oil price or cotton price and stuff - franklin templeton we worry in general that elis is very focused on maximising its cost base.	66.2
Management	perception study - january 2019 management (cont.)	66.0
Mergers and Acquisitions	in order to get the top line going, you need to invest, and it is stuff that for the first few years just does not generate a lot of profitable margin and so he is just more focused on m&a .	64.8
Restructuring	it is just execution on the restructuring and not dropping the ball on the organic growth.	64.4
Strategy execution	on a scale of 1 to 10 how do you rate the execution of elis' strategy ?	61.3
Business model	the first strength is probably the business model , but business model is quite a large word.	59.2
Interest rates	the point is more market perception and with interest rates rising and maybe market slowdown, there are many fears around high indebtedness.	58.9
Leadership	as i said at the beginning, it is a leader .	55.5
Market exposure	not on the management, but on the market , on this balance sheet structure, on the uk exposure , which is part of the business - lide on the negatives, it is hard to know, berendsen might turn out to be brilliant or it might turn out to be a step too far.	54.2
Profitability	in terms of profitability , they have been doing quite well and everything is fine, according to me.	52.3
Geographical specificities	at this point, i think there is no particular mis-executions on their different geographies in terms of integration of acquisitions, for example.	52.1
Track record	basically, if i summarise it, good execution in france, a good track record there of running the operations.	51.3
Pricing power	if they are unable to pass it through, there is a question around their pricing power and there is a question around the competitive dynamics, so that is another point.	51.3
Return to shareholders	forge dividends , i would do a buyback.	46.7
Industry dynamic	it is an industry in consolidation, then consolidation brings higher margins, higher returns.	46.4
Dilution	in terms of their strategy so far, the issue here is that they said we are going to consolidate markets and see margin expansion and i feel like that is being diluted a little bit.	46.1

Barriers to entry	you can see that with mainly distributors, like bunzl, but the barrier to entry is even higher, which is even more positive.	45.3
Competition	there is competition , but the berendsen brand is a strong brand, so there is no reason why it should not continue.	42.2
Industry specificities	there are no synergies, that is exactly what we like in this industry .	41.7
Cyclicality	they are going to face some cost pressures in the short-term, but we see that more cyclical .	41.1
Geographical diversification	regarding the geography , the business is more diversified now after the different acquisitions they made this past three years.	40.8
Macro economics	we will see how they are able to continue to grow in this different, maybe more complicated macroeconomic context.	39.7
Margin evolution	it is a good mix between the organic sales growth and the margin evolution .	36.2
Size ou Scale	that goes then in pair with doing bolt-on acquisitions or a larger scale deal , but i do not think larger deals are on the horizon right now.	30.4
Share liquidity	that is the struggle the shares have at the moment.	28.4
Product diversification	regarding the business, they are quite balanced between workwear, linen, etc .	26.3
Currency	after that, it is also about the free cash flow generation and the roce.	24.1
Deal structure	keep doing small deals, rather than a very big structuring deal , leading to higher indebtedness and maybe capital increase.	23.3
Industry capacity	i think it is going to change now that, for example, they have hired a new ir.	21.1
Technology	seven, for their technical capacity.	18.3
Innovation	for example, for me, indusal was a material acquisition.	17.7
Revenues KPI	there is only a revenue number, so i do not really have much to say about it.	15.6
Environment	you are in a different environment .	13.6
Overhang	uk, that is a question mark.	11.9
Geopolitics	the prospects of a more challenging macro economic / geopolitical environment does not help.	10.9
Backlog	in uk, i hope they could restore the growth base in the future.	10.1
Regulation	i cannot express these kind of views for compliance reasons.	6.7

Classification de commentaires d'investisseurs : Conclusions et perspectives

Classification de commentaires d'investisseurs

Conclusion

- Création corpus propre, non-labellisé
- Classification multi-classes (multi_class=True) pour prendre en compte des sous-catégories
- Peut être combinée avec l'analyse de sentiments pour une classification quantitative (positif/négatif) force/faiblesse
- Summarizer (gensim, lexrank, lsa, textrank, luhn)
- Une liste exhaustive de catégories à quatre niveaux hiérarchiques a été établie et servira de base pour les travaux futurs

Perspectives

- Prospection de différentes méthodes de classification multi-classes hiérarchisées
- Création en cours d'un corpus labellisé, de grande taille, et spécialisé au problème à l'aide de la plateforme <https://prodi.gy/> développée par les créateurs de SpaCy
 - => Affinage du modèle pré-entraîné
 - => Mieux comprendre les problèmes et interpréter les résultats.
